### REC\_DS using C\_Week 4\_CY

Attempt : 1  
Total Mark : 30  
Marks Obtained : 30

#### Section 1 : Coding

##### 1. Problem Statement

Saran is developing a simulation for a theme park where people wait in a queue for a popular ride.

Each person has a unique ticket number, and he needs to manage the queue using a linked list implementation.

Your task is to write a program for Saran that reads the number of people in the queue and their respective ticket numbers, enqueue them, and then calculate the sum of all ticket numbers to determine the total ticket value present in the queue.

##### ***Input Format***

The first line of input consists of an integer N, representing the number of people

in the queue.

The second line consists of N space-separated integers, representing the ticket numbers.

### ***Output Format***

The output prints an integer representing the sum of all ticket numbers.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

2 4 6 7 5

Output: 24

### ***Answer***

```
// You are using GCC
```

```
#include<stdio.h>
```

```
#define max 100
```

```
int rear=-1;
```

```
int front=-1;
```

```
int q[max];
```

```
int isfull(){
```

```
    if(rear==max-1){
```

```
        return 1;
```

```
    }
```

```
    else{
```

```
        return 0;
```

```
    }
```

```
}
```

```
int isempty(){
```

```
    if(front==-1 && rear==-1){
```

```
        return 1;
```

```
    }
```

```
    else{
```

```
        return 0;
```

```
    }
```

```
}
```

```
void insert(int e){
```

```

        if(!isfull()){
            rear++;
            q[rear]=e;
            if(front==-1){
                front=0;
            }
        }
    }
}

void sum(){
    int s;
    s=0;
    if(!isempty()){

        for(int i=front;i<=rear;i++){
            s+=q[i];
        }
        printf("%d",s);
    }

}

int main(){
    int n;
    int el;
    scanf("%d",&n);
    for(int i=0;i<n;i++){
        scanf("%d",&el);
        insert(el);
    }
    sum();
}

```

**Status :** Correct

**Marks :** 10/10

## 2. Problem Statement

Sara builds a linked list-based queue and wants to dequeue and display all positive even numbers in the queue. The numbers are added at the end of the queue.

Help her by writing a program for the same.

### ***Input Format***

The first line of input consists of an integer N, representing the number of elements Sara wants to add to the queue.

The second line consists of N space-separated integers, each representing an element to be enqueued.

### ***Output Format***

The output prints space-separated the positive even integers from the queue, maintaining the order in which they were enqueued.

Refer to the sample output for formatting specifications.

### ***Sample Test Case***

Input: 5

1 2 3 4 5

Output: 2 4

### ***Answer***

```
// You are using GCC
```

```
#include<stdio.h>
```

```
int front=-1;
```

```
int rear=-1;
```

```
#define max 100
```

```
int q[max];
```

```
int isfull(){
```

```
    if(rear==max-1){
```

```
        return 1;
```

```
    }
```

```
    else{
```

```
        return 0;
```

```
    }
```

```
}
```

```
int isempty(){
```

```
    if(rear==-1 && front==-1){  
        return 1;  
    }  
    else{  
        return 0;  
    }  
}
```

```
void enqueue(int e){  
    if(!isfull()){  
        rear++;  
        q[rear]=e;  
        if(front==-1){  
            front=0;  
        }  
    }  
}
```

```
void disp(){  
    if(!isempty()){  
        for(int i=front;i<=rear;i++){  
            if(q[i]%2==0 && q[i]>0){  
                printf("%d ",q[i]);  
            }  
        }  
    }  
}
```

```
int main(){  
    int n;  
    int el;  
    scanf("%d",&n);  
    for(int i=0;i<n;i++){  
        scanf("%d",&el);  
        enqueue(el);  
    }  
    disp();  
}
```

**Status :** Correct

**Marks : 10/10**

### 3. Problem Statement

Pathirana is a medical lab specialist who is responsible for managing blood count data for a group of patients. The lab uses a queue-based system to track the blood cell count of each patient. The queue structure helps in processing the data in a first-in-first-out (FIFO) manner.

However, Pathirana needs to remove the blood cell count that is positive even numbers from the queue using array implementation of queue, as they are not relevant to the specific analysis he is performing. The remaining data will then be used for further medical evaluations and reporting.

#### ***Input Format***

The first line consists of an integer  $n$ , representing the number of a patient's blood cell count.

The second line consists of  $n$  space-separated integers, representing a blood cell count value.

#### ***Output Format***

The output displays space-separated integers, representing the remaining blood cell count after removing the positive even numbers.

Refer to the sample output for formatting specifications.

#### ***Sample Test Case***

Input: 5

1 2 3 4 5

Output: 1 3 5

#### ***Answer***

```
// You are using GCC
#include<stdio.h>
#define max 100
int rear=-1;
int front=-1;
```

```
int q[max];
```

```
int isfull(){
```

```
    if(rear==max-1){
```

```
        return 1;
```

```
    }
```

```
    else{
```

```
        return 0;
```

```
    }
```

```
}
```

```
int isempty(){
```

```
    if(rear==-1 && front==-1){
```

```
        return 1;
```

```
    }
```

```
    else{
```

```
        return 0;
```

```
    }
```

```
}
```

```
void enq(int e){
```

```
    if(!isfull()){
```

```
        rear++;
```

```
        q[rear]=e;
```

```
        if(front==-1){
```

```
            front=0;
```

```
        }
```

```
    }
```

```
}
```

```
void disp(){
```

```
    if(!isempty()){
```

```
        for(int i=front;i<=rear;i++){
```

```
            if(q[i]<0 || q[i]%2!=0){
```

```
                printf("%d ",q[i]);
```

```
            }
```

```
        }
```

```
    }
```

```
}
```

```
int main(){
```

```
    int n;
```

```
    int el;
```

```
    scanf("%d",&n);
```

```
    for(int i=0;i<n;i++){
```

```
scanf("%d",&el);  
    enq(el);  
}  
    disp();  
}
```
